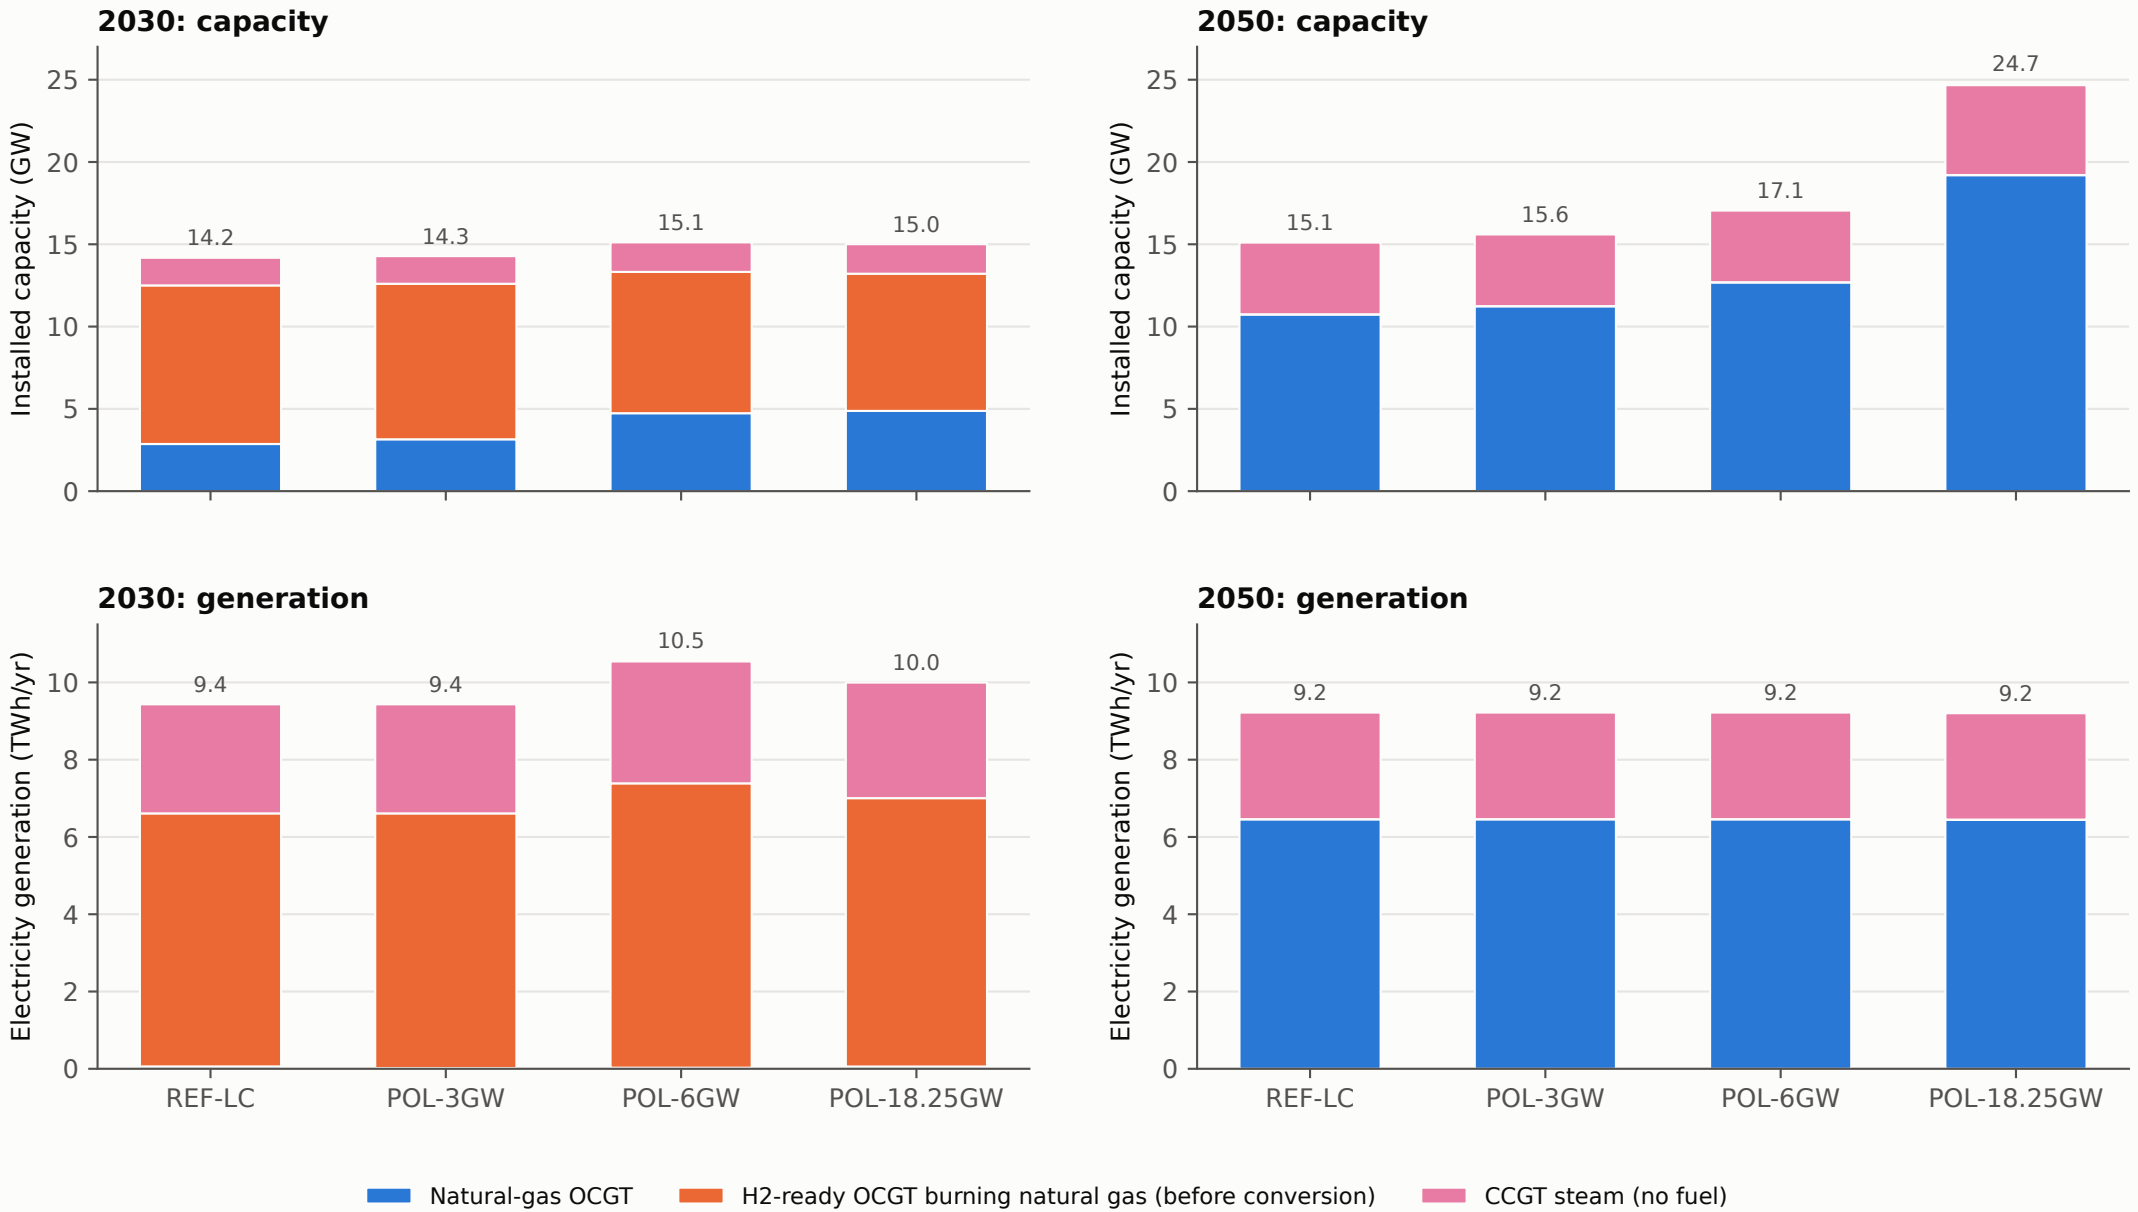
# Natural-gas-fired capacity versus generation, 2030 and 2050

Mandates raise gas-burning capacity but leave gas-fired generation almost unchanged: 6.6-7.4 TWh (2030) and 6.45 TWh (2050) from the OCGTs in every scenario.



Source: PyPSA-RSA gas-to-power study, saved solved networks (REF-LC 22 Oct 2026; POL runs 27 Oct 2026), commit db90bff. 1-node, LC-182h development results - not hourly-resolution findings.
OCGT and steam generation are modelled components, not paired CCGT plants. Steam burns no fuel; all of its feed-gas came from natural-gas-fired OCGT output in these runs (diesel and converted H2 units do not run). By 2050 every H2-ready unit has converted and none runs.
