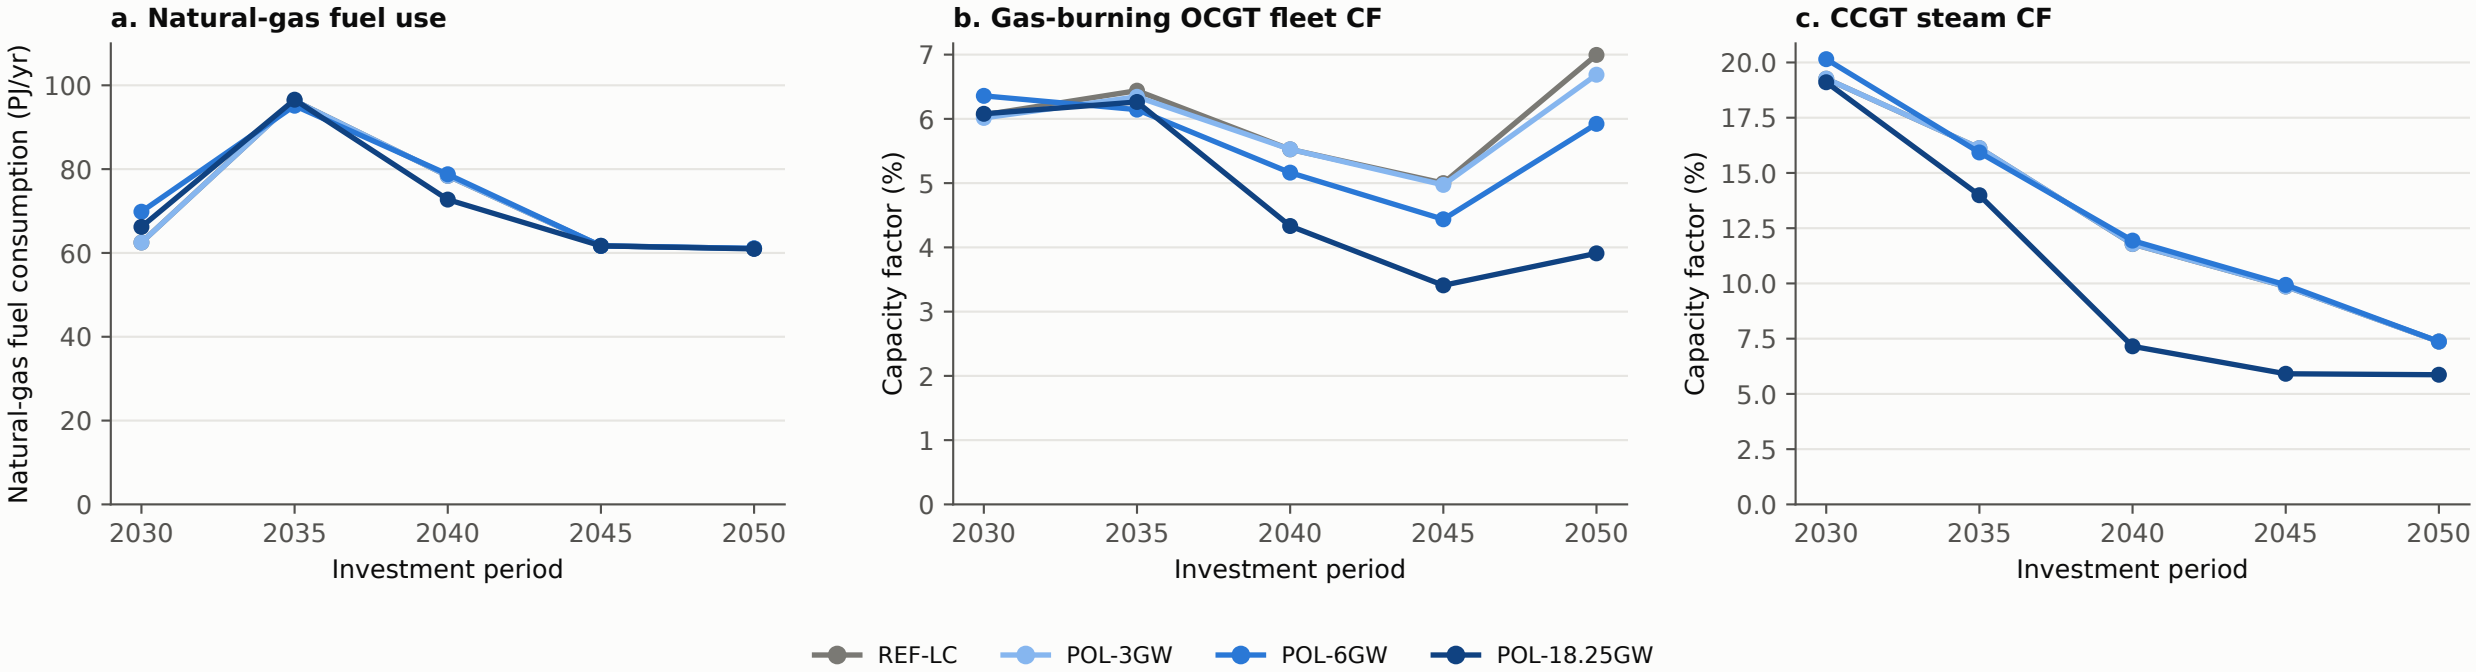
Natural-gas use and utilisation across the transition

Fuel use peaks in 2035 (~96 PJ) and is almost identical across scenarios; capacity factors fall where mandates add capacity (lines overlap where scenarios coincide).



Source: PyPSA-RSA gas-to-power study, saved solved networks (REF-LC 22 Oct 2026; POL runs 27 Oct 2026), commit db90bff. 1-node, LC-182h development results - not hourly-resolution findings.
Fuel = output / efficiency x 3.6 GJ/MWh for units burning natural gas in that period (natural-gas OCGT; H2-ready OCGT before its conversion year; Sasol gas = 0). Steam burns no fuel. CF = annual energy / (capacity in operation x represented hours, 8,594-8,722 h). 2025 omitted (no new gas). LC-182h CFs are indicative only.
