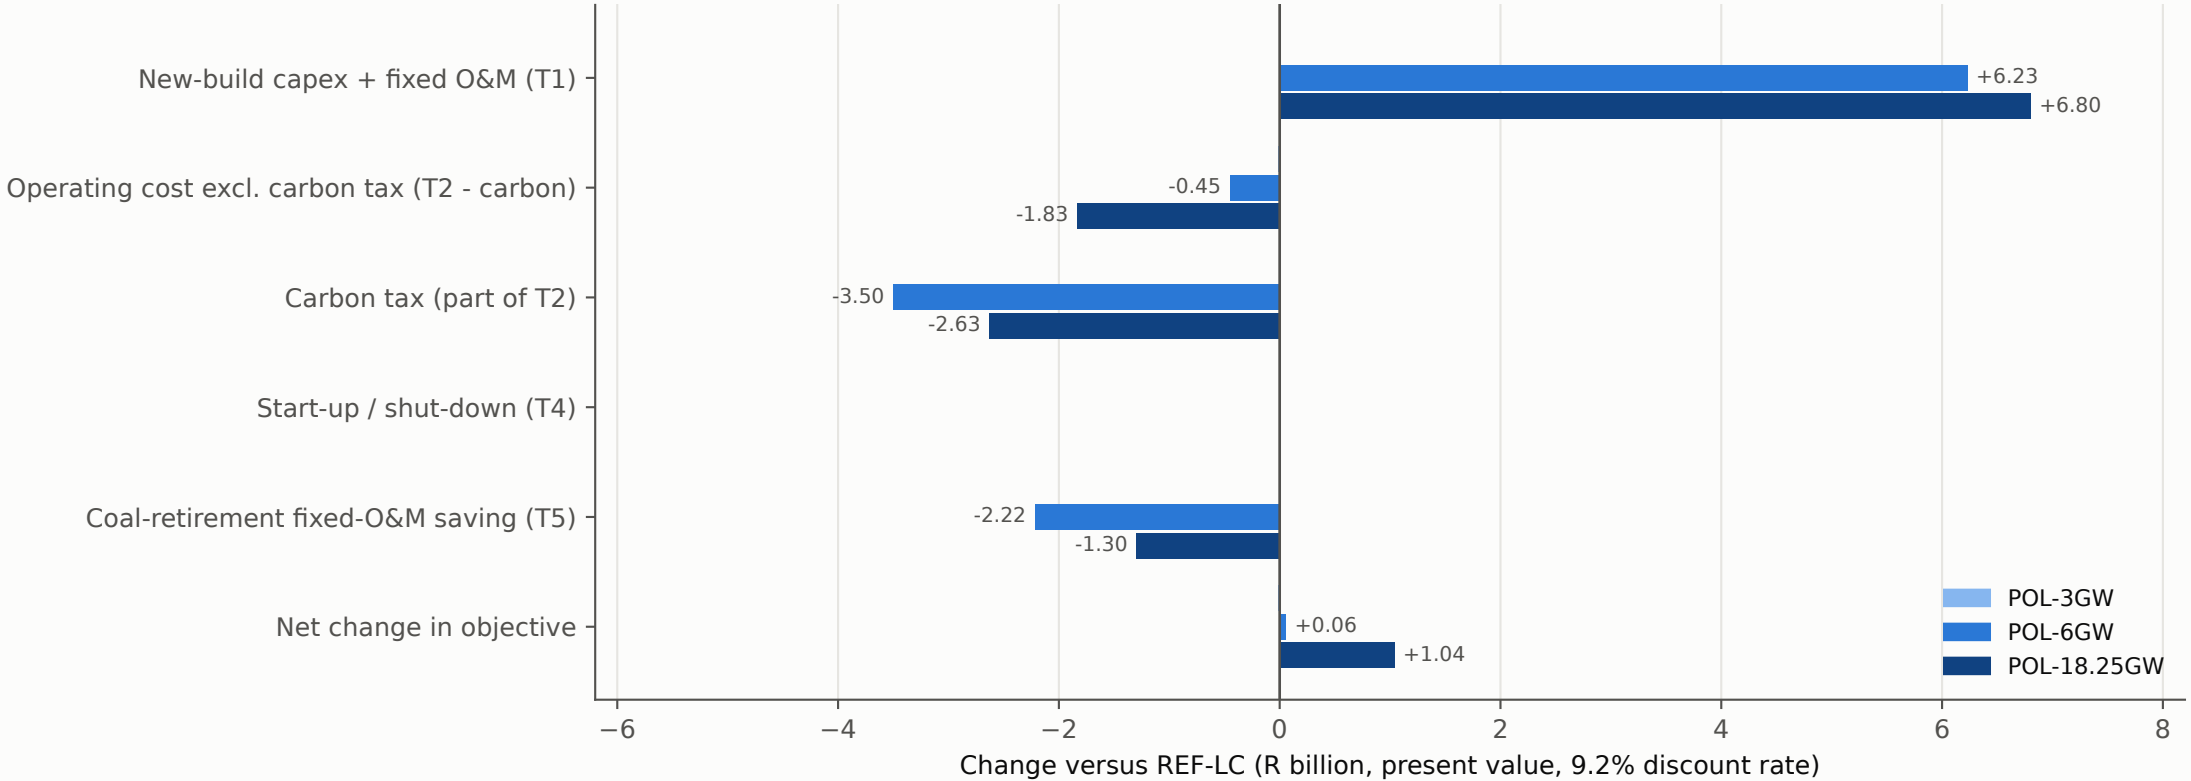
Incremental system cost versus REF-LC by objective term

Net costs are small (POL-6GW +R0.06 bn, POL-18.25GW +R1.04 bn PV) because higher capex is offset by carbon-tax, fuel and coal fixed-O&M savings.



Source: PyPSA-RSA gas-to-power study, saved solved networks (REF-LC 22 Oct 2026; POL runs 27 Oct 2026), commit db90bff. 1-node, LC-182h development results - not hourly-resolution findings.
POL-3GW: every term < R0.02 bn (bars not visible; mandate non-binding). Terms rebuild the optimisation objective exactly (residual 0); n.statistics totals are not used (they omit T5). Carbon tax split from T2 using model emission factors and the CT_2050 path. T6 (retirement constant) is identical in all runs (0 change). Costs in kZAR in the model, shown here in R bn.
